

36 – 75 Vdc Input; 28Vdc Output; 350W Output

RoHS Compliant

- RF Power Amplifier
- Wireless Networks
- Switching Networks

- Auto-restart after either output OCP or OVP fault shutdown (“3” option code)
- Auto-restart only after output OCP fault shutdown (“4” option code)
- Shorter pins (“6” or “8” option code)
- Unthreaded heatsink holes (-18 option code)
- Tunable Loop™ for transient response optimization (-T option code)

The JNW350R series of dc-dc converters are a new generation of isolated DC/DC power modules providing up to 350W output power in an industry standard half-brick size footprint, which makes it an ideal choice for high voltage and high power applications. Threaded-through holes are provided to allow easy mounting or addition of a heatsink for high-temperature applications. The output is fully isolated from the input, allowing versatile polarity configurations and grounding connections. This module contains an optional new feature, the Tunable Loop™, that allows the user to optimize the dynamic response of the converter to match the load with reduced amount of output capacitance, leading to savings on cost and PWB area.

- Compliant to RoHS EU Directive 2011/65/EU and amended Directive (EU) 2015/863. (Z versions)
- Compliant to REACH Directive (EC) No 1907/2006
- Compliant to IPC-9592, Class I, Category 2
- High power density: 129 W/in³
- Industry standard half-brick pin-out
- Industry standard half-brick footprint

57.7mm x 60.7mm x 12.7mm
(2.27" x 2.39" x 0.5")

- 2:1 input voltage range
- Low output ripple and noise
- Constant switching frequency
- Single tightly regulated output
- No minimum load required
- Remote Sense
- Output voltage adjustment trim, 16.8V_{dc} to 32.0V_{dc}
- Accepts transient overloads without shutdown
- Latch after output OVP/OCF fault shutdown
- Over temperature protection, auto restart
- Wide operating case temperature range (-40°C to 100°C)
- CE mark meets 2014/35/EU directive§
- ANSI/UL* 62368-1 and CAN/CSA† C22.2 No. 62368-1 Recognized, DIN VDE‡ 0868-1/A11:2017 (EN62368-1:2014/A11:2017)
- ISO** 9001 and ISO 14001 certified manufacturing facilities

JNW350R Power Modules; DC-DC Converters

36 – 75 Vdc Input; 28Vdc Output; 350W Output

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only, functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect the device reliability.

Parameter	Device	Symbol	Min	Max	Unit
Input Voltage					
Continuous	All	V_{IN}	-0.3	80	V _{dc}
Transient, operational (≤ 100 ms)	All	$V_{IN,trans}$	-0.3	100	V _{dc}
Operating Ambient Temperature					
Note: When the operating ambient temperature is within 55°C ~85°C, the application of the module refers to the derating curves of Figures 21 and 22.	All	T _a	-40	85	°C
Operating Case Temperature (See Thermal Considerations section, Figure 20)	All	T _c	-40	100	°C
Storage Temperature	All	T _{stg}	-55	125	°C
I/O Isolation Voltage: Input to Case, Input to Output	All	—	—	1500	V _{dc}
Output to Case	All	—	—	500	V _{dc}

Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage, resistive load, and temperature conditions.

Parameter	Device	Symbol	Min	Typ	Max	Unit
Operating Input Voltage (see Figure 12 for $V_{IN,min}$ when using trim-up feature)	All	V_{IN}	36	48	75	V _{dc}
Maximum Input Current ($V_{IN}=36V$ to $75V$, $I_O=I_{O,max}$)	All	$I_{IN,max}$			12.5	A _{dc}
Inrush Transient	All	I^2t			2	A ² s
Input Reflected Ripple Current, peak-to-peak (5Hz to 20MHz, 12μH source impedance; $V_{IN}=0V$ to $75V$, $I_O=I_{O,max}$; see Figure 7)	All				20	mA _{p-p}
Input Ripple Rejection (120Hz)	All			50		dB

CAUTION: This power module is not internally fused. An input line fuse must always be used.

This power module can be used in a wide variety of applications, ranging from simple standalone operation to being an integrated part of complex power architecture. To preserve maximum flexibility, internal fusing is not included. Always use an input line fuse, to achieve maximum safety and system protection. The safety agencies require a time-delay or fast-acting fuse with a maximum rating of 20 A (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data sheet for further information.

36 – 75 Vdc Input; 28Vdc Output; 350W Output

Test Configurations

Note: Measure the input reflected-ripple current with a simulated source inductance (LTEST) of 12 μH. Capacitor CS offsets possible battery impedance. Measure the current, as shown above.

Figure 7. Input Reflected Ripple Current Test Setup.

Note: Use a Cout (470 μF Low ESR aluminum or tantalum capacitor typical), a 0.1 μF ceramic capacitor and a 10 μF ceramic capacitor, and Scope measurement should be made using a BNC socket. Position the load between 51 mm and 76 mm (2 in. and 3 in.) from the module.

Figure 8. Output Ripple and Noise Test Setup.

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

$$\eta = \left(\frac{[V_O(+)-V_O(-)]I_O}{[V_I(+)-V_I(-)]I_I} \right) \times 100 \%$$

Figure 9. Output Voltage and Efficiency Test Setup.

Design Considerations

Input Source Impedance

The power module should be connected to a low ac-impedance source. A highly inductive source impedance can affect the stability of the power module. For the test configuration in Figure 7, a 470μF Low ESR aluminum capacitor, C_{IN} , mounted close to the power module helps ensure the stability of the unit. Consult the factory for further application guidelines

Output Capacitance

The JNW350R power module requires a minimum output capacitance of 440μF Low ESR aluminum capacitor, C_{out} to ensure stable operation over the full range of load and line conditions, see Figure 8. If the ambient temperature is under -20C, it is required to use at least 3 pcs of minimum capacitors in parallel. In general, the process of determining the acceptable values of output capacitance and ESR is complex and is load-dependent.

Safety Considerations

For safety agency approval the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standards, i.e., UL ANSI/UL 62368-1 and CAN/CSA C22.2 No. 62368-1 Recognized, DIN VDE 0868-1/A11:2017 (EN62368-1:2014/A11:2017)

For end products connected to -48V dc, or -60Vdc nominal DC MAINS (i.e. central office dc battery plant), no further fault testing is required. *Note: -60V dc nominal battery plants are not available in the U.S. or Canada.

For all input voltages, other than DC MAINS, where the input voltage is less than 60V dc, if the input meets all of the requirements for SELV/ES1, then:

- The output may be considered SELV/ES1. Output voltages will remain within SELV/ES1 limits even with internally-generated non-SELV/ES2 voltages. Single component failure and fault tests were performed in the power converters.
- One pole of the input and one pole of the output are to be grounded, or both circuits are to be kept floating, to maintain the output voltage to ground voltage within ELV or SELV/ES1 limits. However, SELV/ES1 will not be maintained if $V_I(+)$ and $V_O(+)$ are grounded simultaneously.

JNW350R Power Modules; DC-DC Converters

36 – 75 Vdc Input; 28Vdc Output; 350W Output

Safety Considerations (continued)

For all input sources, other than DC MAINS, where the input voltage is between 60 and 75V dc (Classified as TNV-2 in Europe), the following must be met, if the converter's output is to be evaluated for SELV/ES1:

- The input source is to be provided with reinforced insulation from any hazardous voltage, including the ac mains.
- One V_{IN} pin and one V_{OUT} pin are to be grounded, or both the input and output pins are to be kept floating.
- Another SELV or ES1 reliability test is conducted on the whole system (combination of supply source and subject module), as required by the safety agencies, to verify that under a single fault, hazardous voltages do not appear at the module's output.

All flammable materials used in the manufacturing of these modules are rated 94V-0, or tested to in-situ needle flame test for reduced thickness.

The input to these units is to be provided with a maximum 20 A fast-acting or time-delay fuse in the unearthed lead.

Feature Description

Remote On/Off

Two remote on/off options are available. Positive logic turns the module on during a logic high voltage on the ON/OFF pin, and off during a logic low. Negative logic remote On/Off, device code suffix "1", turns the module off during a logic high and on during a logic low.

To turn the power module on and off, the user must supply a switch (open collector or equivalent) to control the voltage ($V_{on/off}$) between the ON/OFF terminal and the $V_{IN(-)}$ terminal (see Figure 10). Logic low is $0V \leq V_{on/off} \leq 1.2V$. The maximum $I_{on/off}$ during a logic low is 1mA, the switch should be maintain a logic low level whilst sinking this current.

During a logic high, the typical maximum $V_{on/off}$ generated by the module is 5V, and the maximum allowable leakage current at $V_{on/off} = 5V$ is 50 μ A.

If not using the remote on/off feature:

For positive logic, leave the ON/OFF pin open.

For negative logic, short the ON/OFF pin to $V_{IN(-)}$.

Over-Current Protection (OCP)

To provide protection in a fault output overload

Figure 10. Circuit configuration for using Remote On/Off Implementation.

condition, the module is equipped with internal current limiting protection circuitry, and can endure over-current transient overloads depending upon the duration and amplitude of the overload. An internal buffer measures the relative product of the duration and amplitude of the overload and allows operation until a limit threshold is reached. For lower amplitude overloads, the module will operate without shutdown for a longer transient overload. If the overload amplitude is larger, the module will reach shutdown in a shorter period of time.

A latching shutdown option is standard. If over-current persists for beyond the overload buffer, the module will shut down and remain off until the module is reset by either cycling the input power or by toggling the on/off pin for one second.

An OCP auto-restart option (code = 3 or 4, see Table 2) is also available in a case where an auto recovery is required. Once the module has shutdown, after a period of several 100's of milliseconds, the module will restart. If the output overload condition still exists when the module restarts, it will shut down again. This operation will continue indefinitely, until the over-current condition is corrected.

Over-Voltage Protection (OVP)

The output over-voltage protection consists of circuitry that monitors the voltage on the output terminals. If the voltage on the output terminals exceeds the over voltage protection threshold, then the module will shutdown and latch off. The over-voltage latch is reset by either cycling the input power for one second or by toggling the on/off signal for one second. The protection mechanism is such that the unit can continue in this condition until the fault is cleared.

An OVP auto-restart option (code = 3, see Table 2) is also available in a case where an auto recovery is required. Once the module has shutdown, after a period of several 100's of milliseconds, the module will restart. If the output overload condition still exists when the module restarts, it will shut down again. This operation will continue indefinitely, until the over-current condition is corrected.

JNW350R Power Modules; DC-DC Converters

36 – 75 Vdc Input; 28Vdc Output; 350W Output

Feature Description (continued)

Remote sense

Remote sense minimizes the effects of distribution losses by regulating the voltage at the remote-sense connection (see Figure 11). For No Trim or Trim down application, the voltage between the remote-sense pin and the output terminal must not exceed the output voltage sense range given in the Feature Specifications table i.e.: $\text{SENSE}(+) - V_o(+) \leq 2\% \text{ of } V_{o,nom}$.

The voltage between the $V_o(+)$ and $V_o(-)$ terminals must not exceed the minimum output over-voltage shut-down value indicated in the Feature Specifications table. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment (trim). See Figure 11. Do not connect $\text{SENSE}(-)$ to the $V_o(-)$ or $R_{load}(-)$ as there is a 0Ω connection internal to the module. If not using the remote-sense feature to regulate the output at the point of load, then connect $\text{SENSE}(+)$ to $V_o(+)$.

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim. The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim: the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power.

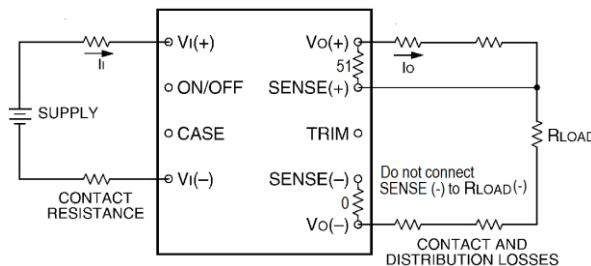

Figure 11. Effective Circuit Configuration for Single-Module Remote-Sense Operation Output Voltage.

Output Voltage Programming

Trimming allows the user to increase or decrease the output voltage set point of a module. The trim resistor should be positioned close to the module. Certain restrictions apply to the input voltage lower limit when trimming the output voltage to the maximum. See Figure 12 for the allowed input to output range when using trim. If not using the trim down feature, leave the TRIM pin open.

Figure 12. Output voltage trim limits vs. Input Voltage.

Modules without the –T Option

Trim Down – Decrease Output Voltage

Trimming down is accomplished by connecting an external resistor between the TRIM pin and the $\text{SENSE}(-)$ pin. With an external resistor ($R_{adj-down}$) between the TRIM and $\text{SENSE}(-)$ pins, the output voltage set point ($V_{o,adj}$) decreases (see Figure 13). The following equation determines the required external-resistor value to obtain a percentage output voltage change of $\Delta\%$.

For output voltages: 28V

$$R_{adj-down} = \left(\frac{100}{\Delta\%} - 2 \right) k\Omega$$

Where,

$$\Delta\% = \left| \frac{V_{o,nom} - V_{desired}}{V_{o,nom}} \right| \times 100$$

$V_{desired}$ = Desired output voltage set point (V).

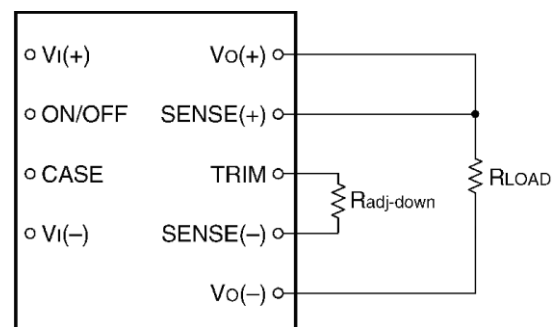

Figure 13. Circuit Configuration to Decrease Output Voltage, Standard JNW350R.

Trim Up – Increase Output Voltage

Trimming up is accomplished by connecting external resistor between the $\text{SENSE}(+)$ pin and TRIM pin. With an external resistor (R_{adj-up}) connected between the $\text{SENSE}(+)$ and TRIM pins, the output voltage set point ($V_{o,adj}$) increases (see Figure 14).

JNW350R Power Modules; DC-DC Converters

36 – 75 Vdc Input; 28Vdc Output; 350W Output

Feature Description (continued)

The following equation determines the required external-resistor value to obtain a percentage output voltage change of $\Delta\%$.

For output voltages: 28V

$$R_{adj-up} = \left[\frac{V_{o,nom} \times (100 + \Delta\%)}{1.225 \times \Delta\%} - \frac{(100 + (2 \times \Delta\%))}{\Delta\%} \right] k\Omega$$

Where,

$$\Delta\% = \left| \frac{V_{desired} - V_{o,nom}}{V_{o,nom}} \right| \times 100$$

$V_{desired}$ = Desired output voltage set point (V).

Figure 14. Circuit Configuration to Increase Output Voltage, Standard JNW350R.

Examples:

To trim down the output of a nominal 28V module to 16.8V

$$\Delta\% = \left| \frac{28V - 16.8V}{28V} \right| \times 100$$

$$\Delta\% = 40$$

$$R_{adj-down} = \left(\frac{100}{40} - 2 \right) k\Omega$$

$$R_{adj-down} = 0.5 k\Omega$$

To trim up the output of a nominal 28V module to 30.8V

$$\Delta\% = \left| \frac{30.8V - 28V}{28V} \right| \times 100$$

$$\Delta\% = 10$$

$$R_{adj-up} = \left[\frac{28 \times (100 + 10)}{1.225 \times 10} - \frac{(100 + (2 \times 10))}{10} \right] k\Omega$$

$$R_{adj-up} = 239.4 k\Omega$$

Modules with the -T Option

Trim Down – Decrease Output Voltage

With an external resistor ($R_{adj-down}$) between the TRIM and SENSE(+) pins, the output voltage set point ($V_{o,adj}$) decreases (see Figure 15). The following equation determines the required external-resistor value to obtain a percentage output voltage change of $\Delta\%$.

For output voltages: 28V

$$R_{adj-down} = \left(\frac{10631.45}{\Delta\%} - 111.2 \right) k\Omega$$

Where,

$$\Delta\% = \left| \frac{V_{o,nom} - V_{desired}}{V_{o,nom}} \right| \times 100$$

$V_{desired}$ = Desired output voltage set point (V).

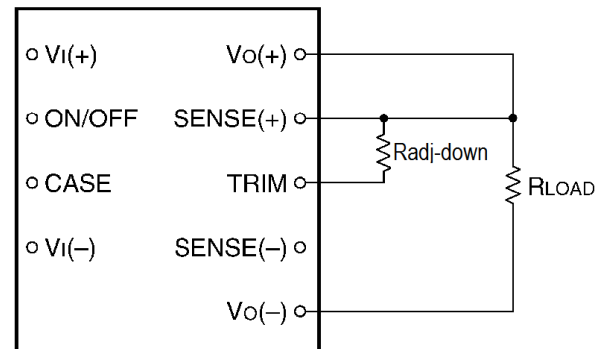

Figure 15. Circuit Configuration to Decrease Output Voltage, JNW350R-T option.

Trim Up – Increase Output Voltage

With an external resistor (R_{adj-up}) connected between the SENSE(-) and TRIM pins, the output voltage set point ($V_{o,adj}$) increases (see Figure 16).

The following equation determines the required external-resistor value to obtain a percentage output voltage change of $\Delta\%$.

For output voltages: 28V

$$R_{adj-up} = \left(\frac{488.5}{\Delta\%} \right) k\Omega$$

Where,

$$\Delta\% = \left| \frac{V_{desired} - V_{o,nom}}{V_{o,nom}} \right| \times 100$$

$V_{desired}$ = Desired output voltage set point (V).

JNW350R Power Modules; DC-DC Converters

36 – 75 Vdc Input; 28Vdc Output; 350W Output

Feature Description (continued)

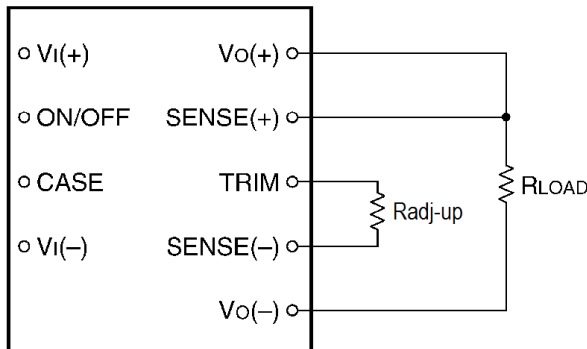

Figure 16. Circuit Configuration to Increase Output Voltage, JNW350Rx-T option.

Examples:

To trim down the output of a nominal 28V JNW350-T module to 16.8V

$$\Delta\% = \left| \frac{28V - 16.8V}{28V} \right| \times 100$$

$$\Delta\% = 40$$

$$R_{adj-down} = \left(\frac{10631.45}{40} - 111.2 \right) k\Omega$$

$$R_{adj-down} = 154.5 \text{ k}\Omega$$

To trim up the output of a nominal 28V JNW350-T module to 30.8V

$$\Delta\% = \left| \frac{30.8V - 28V}{28V} \right| \times 100$$

$$\Delta\% = 10$$

$$R_{adj-up} = \left(\frac{488.5}{10} \right) k\Omega$$

$$R_{adj-up} = 48.8 \text{ k}\Omega$$

Active Voltage Programming

For both the JNW350Rx and JNW350Rx-T, a Digital-Analog converter (DAC), capable of both sourcing and sinking current, can be used to actively set the output voltage, as shown in Figure 17. The value of R_G will be dependent on the voltage step and range of the DAC and the desired values for trim-up and trim-down $\Delta\%$. Please contact your GE technical representative to obtain more details on the selection for this resistor.

Figure 17. Circuit Configuration to Actively Adjust the Output Voltage.

Tunable Loop™

The JNW350Rx-T modules have a new feature that optimizes transient response of the module called Tunable Loop™.

External capacitors are usually added to the output of the module for two reasons: to reduce output ripple and noise and to reduce output voltage deviations from the steady-state value in the presence of dynamic load current changes. Adding external capacitance however affects the voltage control loop of the module, typically causing the loop to slow down with sluggish response. Larger values of external capacitance could also cause the module to become unstable.

The Tunable Loop™ allows the user to externally adjust the voltage control loop to match the filter network connected to the output of the module. The Tunable Loop™ is implemented by connecting a series R-C between the SENSE(+) and TRIM pins of the module, as shown in Fig. 48. This R-C allows the user to externally adjust the voltage loop feedback compensation of the module.

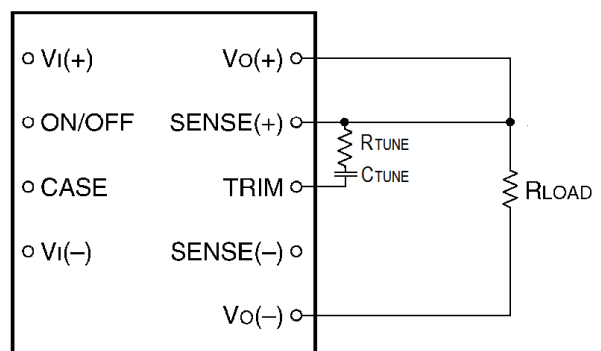

Figure 18. Circuit diagram showing connection of R_{TUNE} and C_{TUNE} to tune the control loop of the module.

Recommended values of R_{TUNE} and C_{TUNE} for different output capacitor combinations are given in Tables 1 and 2. Table 1 shows the recommended values of R_{TUNE} and C_{TUNE}

JNW350R Power Modules; DC-DC Converters

36 – 75 Vdc Input; 28Vdc Output; 350W Output

for different values of ceramic output capacitors up to 8000µF that might be needed for an application to meet output ripple and noise requirements. Selecting R_{TUNE} and C_{TUNE} according to Table 2 will ensure stable operation of the module

In applications with tight output voltage limits in the presence of dynamic current loading, additional output capacitance will be required. Table 2 lists recommended values of R_{TUNE} and C_{TUNE} in order to meet 2% output voltage deviation limits for some common output voltages in the presence of a 6A to 12A step change (50% of full load), with an input voltage of 48V.

Table 1. General recommended values of R_{TUNE} and C_{TUNE} for $V_{out}=28V$ and various external ceramic capacitor combinations.

$C_{out}(\mu F)$	1100	2200	4400	6600	8000
$R_{TUNE}(k\Omega)$	348	200	51.1	36.5	40.2
$C_{TUNE}(pF)$	1500	6800	10,000	15,000	15,000

Table 2. Recommended values of R_{TUNE} and C_{TUNE} to obtain transient deviation of 2% of V_{out} for a 6A step load with $V_{in}=48V$.

V_o	32V	28V	25V	22V	19V	16.8V
$C_o(\mu F)$	880	880	1100	1320	1320	1540
$R_{TUNE}(k\Omega)$	1000	402	348	221	84.5	61.9
$C_{TUNE}(pF)$	820	1500	1500	2200	3300	6800
$\Delta V(mV)$	530	500	530	420	370	317

Please contact your GE technical representative to obtain more details of this feature as well as for guidelines on how to select the right value of external R-C to tune the module for best transient performance and stable operation for other output capacitance values.

Over Temperature Protection

The JNW350R module provides with non-latching over temperature protection. A temperature sensor monitors the operating temperature of the converter. If the reference temperature exceeds a threshold of 110 °C (typical) at the center of the baseplate, the converter will shut down and disable the output. When the baseplate temperature has decreased by approximately 20 °C the converter will automatically restart.

Thermal Considerations

The power modules operate in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat-dissipating components inside the unit are thermally coupled to the case. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the case temperature. Peak temperature (T_{REF}) occurs at the position indicated in Figure 15.

Considerations include ambient temperature, airflow, module power dissipation, and the need for increased reliability. A reduction in the operating temperature of the module will result in an increase in reliability. The thermal data presented here is based on physical measurements taken in a wind tunnel.

For reliable operation this temperature should not exceed 100°C at T_{REF1} for cold plate applications or exceed 112°C at T_{REF2} for applications using forced convection airflow. The output power of the module should not exceed the rated power for the module as listed in the ordering information table. Although the maximum T_{REF} temperature of the power modules is discussed above, you can limit this temperature to a lower value for extremely high reliability.

Figure 19. Case (T_{REF}) Temperature Measurement Location (top view).

Thermal Derating

Thermal derating is presented for two different applications: 1) Figure 20, the JNW350R module is thermally coupled to a cold plate inside a sealed clamshell chassis, without any internal air circulation; and 2) Figure 21 and 22, the JNW350R module is mounted in a traditional open chassis or cards with forced air flow. In application 1, the module is cooled entirely by conduction of heat from the module primarily through the top surface to a coldplate, with some conduction through the module's pins to the power layers in the system board. For application 2, the module is cooled by heat removal into a forced airflow that passes through the interior of the module and over the top baseplate and/or attached heatsink.

Figure 22. Derating Output Current vs. local Ambient temperature and Airflow, 1" Heatsink, $V_{in}=48\text{V}$.

Layout Considerations

The JNW350R power module series are aluminum base board packaged style, as such; component clearance between the bottom of the power module and the mounting (Host) board is limited. Avoid placing copper areas on the outer layer directly underneath the power module.

Post Solder Cleaning and Drying Considerations

Post solder cleaning is usually the final circuit-board assembly process prior to electrical board testing. The result of inadequate cleaning and drying can affect both the reliability of a power module and the testability of the finished circuit-board assembly. For guidance on appropriate soldering, cleaning and drying procedures, refer to *GE Board Mounted Power Modules: Soldering and Cleaning Application Note*.

Through-Hole Lead-Free Soldering Information

The RoHS-compliant through-hole products use the SAC (Sn/Ag/Cu) Pb-free solder and RoHS-compliant components. They are designed to be processed through single or dual wave soldering machines. The pins have an RoHS-compliant finish that is compatible with both Pb and Pb-free wave soldering processes. A maximum preheat rate of 3°C/s is suggested. The wave preheat process should be such that the temperature of the power module board is kept below 210°C . For Pb solder, the recommended pot temperature is 260°C , while the Pb-free solder pot is 270°C max. Not all RoHS-compliant through-hole products can be processed with paste-through-hole Pb or Pb-free reflow process. If additional information is needed, please consult with your GE representative for more details.

EMC Considerations

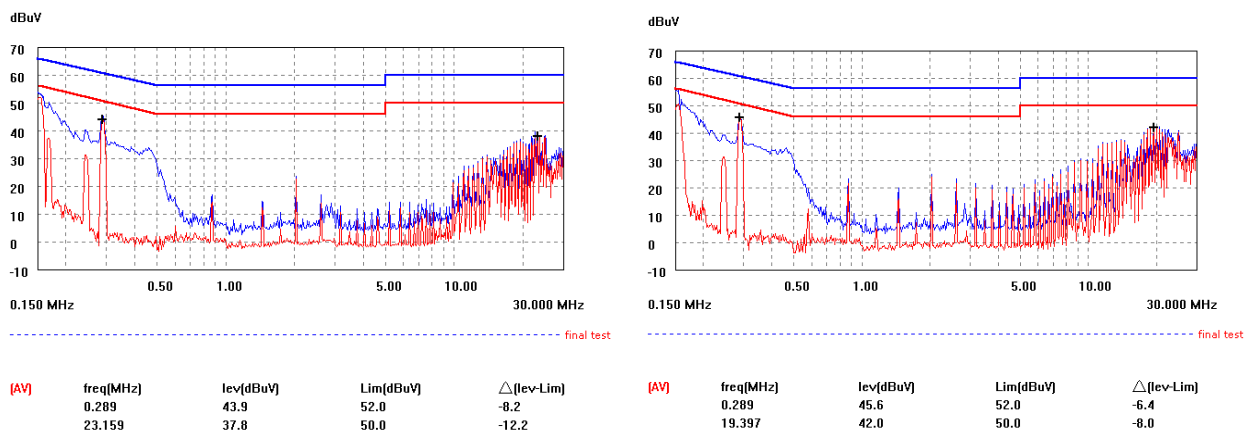

The filter circuit schematic and plots in Figure 23 shows a suggested configuration as tested to meet the conducted emission limits of EN55032 Class B.

Note: Customer is ultimately responsible for the proper selection, component rating and verification of the suggested parts based on the end application.

Symbol	Component Description
C1 – C5	SMD Ceramic Capacitor: 1000nF/100V/X7R/1210
C6	SMD Ceramic Capacitor : 100nF/100V/X7R/1206
L1, L2	CM inductor-single phase: 473uH-14A-R5K-1*25.4*12.7mm
C8 – C11	SMD Ceramic Capacitor: 0.22uF/630V/X7R/2220, meet 1kV endure voltage requirement.
C7	Electrolytic capacitor: 470uF, 100V
C12	Electrolytic capacitor: 470uF, 35V
L3	CM inductor-single phase core: 17uH- R7K-25*15*12; winding: 5TS
